

# GROW

## Your web workflow:

## Your web workflow with Grow:

# GROW

## FEATURE RUNDOWN

### Launch pipeline

See all the launches your team is working on. Grow shows you the pulse of your organization's web workflow via easy-to-use dashboards.

### Clearance for launch

Fine-tuned control over the sign-off and approval process for each project. Content and design sign-off are built-in.

### On-demand deployment

You can easily schedule launches to happen at the exact time of a marketing event. Or press a big, fat "launch now" button.

### Agile task management

Use a lightweight task management system to keep everyone on the same page.

### Security first

Before each launch, Grow runs basic security tests to proactively protect your users.

### Fully international

The rest of the world shouldn't come second. Grow makes building international web sites easy and provides tools specialized for translators.

## The best way for your whole team to build professional creative web sites, together.

Ten years ago it was possible for a single person to build a great web site. Now, the best web sites are made by teams of people of all backgrounds: designers, engineers, writers, translators, project managers, creative agencies, and the people that sign off on the finished product at the end of the day. Grow is a space for everyone to collaborate and **build better web sites, together.**

## Mission Control for your web workflow.

### AGILE WEB DELIVERY

Modern web site production needs a collaborative, social, and rapid environment. That's what Grow provides.

### START UP IN SECONDS

Start a project, invite collaborators, assign tasks and issues, stage sites for launch, and perform a launch review. Grow makes all of these operations happen in seconds. Stop guessing about where you are in a project's lifecycle.

### DEVELOPMENT THAT DOESN'T SUCK

Grow provides a modern, open source web site development platform and CMS. It's file-based and simple, so you can learn it in under an hour. It runs both locally and in the cloud. There's no need to point and click through slow web UIs. Use your tools, code anywhere.

### CONTENT ZEN

Content is king, so Grow provides best-in-class tools for modeling, designing, writing, and reviewing content.

## The launch button for your web sites.

Launches are the most stressful part of the web workflow. Grow fixes that. **Launches happen on your schedule.** You review them, you say when they go live. Grow's launch procedure integrates with your existing tools and it can deploy to Google App Engine, Google Cloud Storage, Amazon S3, GitHub Pages, Dropbox, or any static web server.

Grow is a project by Jeremy Weinstein, who has more than five years of experience managing and launching web sites at Google. Grow (the company) also provides launch services for companies and creative agencies. To learn more, email [jeremydw@grow.io](mailto:jeremydw@grow.io).
